PROFESSIONAL SUMMARY

- Ph.D. candidate in Electrical and Computer Engineering at Binghamton University specializing in reinforcement learning, control, and legged/humanoid robotics
- Prior experience in projects like Unitree G1 fault-tolerant locomotion improving two-joint-fault success from 0% to 72%, and PPO-based Go1 control with 41% lower mechanical CoT and 0.25–0.33 s faster disturbance recovery

EDUCATION

Binghamton University, SUNY, Thomas J. Watson College of Engineering and Applied Science **Binghamton, NY**
Michigan Technological University **Houghton, MI**
Doctor of Philosophy in Electrical and Computer Engineering *Expected May 2028*
Dissertation: Legged locomotion for Human and Humanoid robots in varied gravitational environments.

Michigan Technological University **Houghton, MI**
Master of Science in Mechatronics, Robotics, and Automation Engineering *Jan 2022 - Dec 2023*

Visveswaraya Technological University, JSSATE **Karnataka, India**
Bachelor of Science in Mechanical Engineering *Jun 2017 - Aug 2021*

TECHNICAL SKILLS

Programming & Machine Learning: Stable-Baselines3, Gymnasium, Git/GitHub, Linux, Python, C++, MATLAB, PyTorch
Robotics & Simulation: MuJoCo, ROS, Isaac Gym, RoboGuide, FANUC Robot Programming
Hardware & Industrial Automation: Unitree Go1/G1, Intel RealSense, NVIDIA Jetson Nano, FANUC Robots, Allen-Bradley PLCs

RESEARCH EXPERIENCE

Binghamton University, RoLAC Lab **Binghamton, NY**
Research Assistant (Fault tolerant goal oriented robot locomotion) *Aug 2026 - Sep 2026*

- Developed SAC reinforcement-learning controllers for a 23-DoF Unitree G1 humanoid walking using Python, MuJoCo, Gymnasium, and Stable-Baselines3, increasing simulated success rate under two joint-lock faults from 0% to 72%
- Implemented torque-limiting controls, reducing peak torque by 26% (70 to 52 Nm) versus the uncapped policy with a hip joint locked
- Trained fault-tolerant crawling policies, increasing survival rate with forward progress from 65% to 92.5% under three simultaneous knee/ankle joint locks with hips free in simulation

Binghamton University, RoLAC Lab **Binghamton, NY**
Research Assistant (Template model based analysis of human locomotion gaits) *June 2025 - Present*
Funded by NASA

- Built a 9-DOF compliant planar biped and an end-to-end SAC pipeline in MuJoCo/Gymnasium in which walking, aerial running, and skipping all emerged from a single gait-agnostic reward - no gait labels, reference trajectories, or prescribed contact schedule
- Validated frozen controllers on achieving 100% fall-free trials across the three gaits with 0.07–0.26 m/s steady-state velocity-tracking RMSE, 0.44–0.84 mechanical cost of transport
- Developing an 18-muscle actuators musculoskeletal biped to be trained for efficiency optimization in Earth and lunar gravity locomotion

Binghamton University, RoLAC Lab **Binghamton, NY**
Research Assistant (Learning-Based Quadruped Locomotion and Autonomous Navigation) *Jan 2025 - Mar 2025*

- Developed a VLM–RL autonomous navigation stack integrating LiDAR, RealSense/YOLO perception, A* planning, and learned locomotion, achieving 92% task completion across 10 randomized physical Unitree Go1 trials with a 101 s mean completion time
- Evaluated cyber-physical robustness through prompt-injection attacks, demonstrating 90% attack success and a 23 s mean redirection time without modifying VLM weights or training data

Michigan Technological University, Department of Electrical Engineering **Houghton, MI**
Research Assistant (Benchmarking controls for legged robot locomotion) *Aug 2023 - Mar 2024*
Funded by NSF

- Developed a standardized MuJoCo benchmarking framework for a 12-DoF Unitree Go1, implementing PPO reinforcement learning and predictive-sampling MPC for 0.5 m/s locomotion; evaluated both controllers under identical disturbance and terrain conditions
- Demonstrated that PPO achieved 41% lower mechanical Cost of Transport (1.768 vs. 2.993) and 0.25–0.33 s faster disturbance recovery, while quantifying controller robustness under perturbations of up to 950 N

Michigan Technological University, Department of Electrical Engineering **Houghton, MI**
Course Project (Simulation based industrial assembly line using HIL with PLC module) *Mar 2023 - Apr 2023*

- Integrated an Allen-Bradley PLC with FANUC RoboGuide over EtherNet/IP, configuring PLC/robot I/O for a simulated car-door assembly cell with 3 FANUC R-2000iB/165F robots, 2 conveyor lines, and pick-and-place/welding operations
- Developed RSLogix 5000 ladder logic and a FactoryTalk HMI for remote production-start control and bidirectional PLC–robot communication, enabling hardware-in-the-loop validation of the automated cell prior to physical testing
